

## **Mesh Assignment Report**

Submission by: Bhavahith Prabhu M

### **EXECUTIVE SUMMARY**

- Processed 8 meshes (cylinder, fence, person, explosive, talwar, branch, table, girl)
- Implemented Min-Max [0,1] and Unit Sphere → [0,1] normalization
- Quantized to 1024 bins (10-bit)
- Achieved average MAE:

MinMax : 0.000202

UnitSphere : 0.000417

→ MinMax wins by 51.5% lower error

### **KEY FINDINGS**

1. MinMax always gives lower error because it uses full 1024 bins per axis
2. UnitSphere preserves shape better (no aspect-ratio distortion)
3. Talwar (very thin blade) shows biggest error gap: 0.000102 vs 0.000332
4. All reconstructed meshes visually identical at 1024 bins

### **RECOMMENDATION FOR SeamGPT**

Use MinMax + 1024-bit quantization for training data → minimal information loss.
